A const void * points to memory that should not be modified.. A void * (non-const) points to memory that could be modified (but not via the void *; you'd have to cast it first).. When you use memmove(), the source address is cast to const void *:.. void *memmove(void *dst, const void *src, size_t nbytes); That is an illustration when a void pointer can be cast to a constant void pointer.

You should definitely NOT use using namespace in headers for precisely the reason you say, that it can unexpectedly change the meaning of code in any other files that include that header. There's no way to undo a using namespace which is another reason it's so dangerous. I typically just use grep or the like to make sure that using namespace isn't being called out in headers rather than trying ...
