A quantitative trait locus (QTL) is a locus (section of DNA) which correlates with variation of a quantitative trait in the phenotype of a population of organisms. QTLs are mapped by identifying which molecular markers (such as SNPs or AFLPs) correlate with an observed trait. This is often an early step in identifying and sequencing the actual genes that cause the trait variation.

Genetics is a branch of biology concerned with the study of genes, genetic variation, and heredity in organisms.. Gregor Mendel, a scientist and Augustinian friar, discovered genetics in the late 19th-century.Mendel studied "trait inheritance", patterns in the way traits are handed down from parents to offspring. He observed that organisms (pea plants) inherit traits by way of discrete "units ...

Searching for Answers in the DNA. In theory, a genetic marker can be any type of biomolecule or assay that allows us to "read" inherited differences among individuals in their DNA sequences. Blood groups, protein isozymes, and human leukocyte antigens (HLAs) were among the first developed markers, but even simple traits that are controlled by single genes (e.g., eye color) can also serve ...

The earliest visualizable lesion of atherosclerosis is the fatty streak, which is an accumulation of lipid-laden macrophages in the vascular intima (FIGURE 12.1, FIGURE 12.2). 4 Fatty streaks can be appreciated grossly as focal yellow areas of discoloration of intimal surface. These lipid-laden macrophages are often referred to as foam cells because of their foamy appearance.
